

# Labdoo.org “autodeploy” and “auto install content” scripts

These 2 **bash** scripts are designed to automate the restoration of the images and the content of the lubuntu 18.04 based labdoo systems, allowing to perform a complete end-to-end sanitazion of the laptop in an unattended way.

## **Autodeploy\_18.sh :**

- shredding of the harddrive (optional)

- restoration of the selected image

- configuration of a new hostid

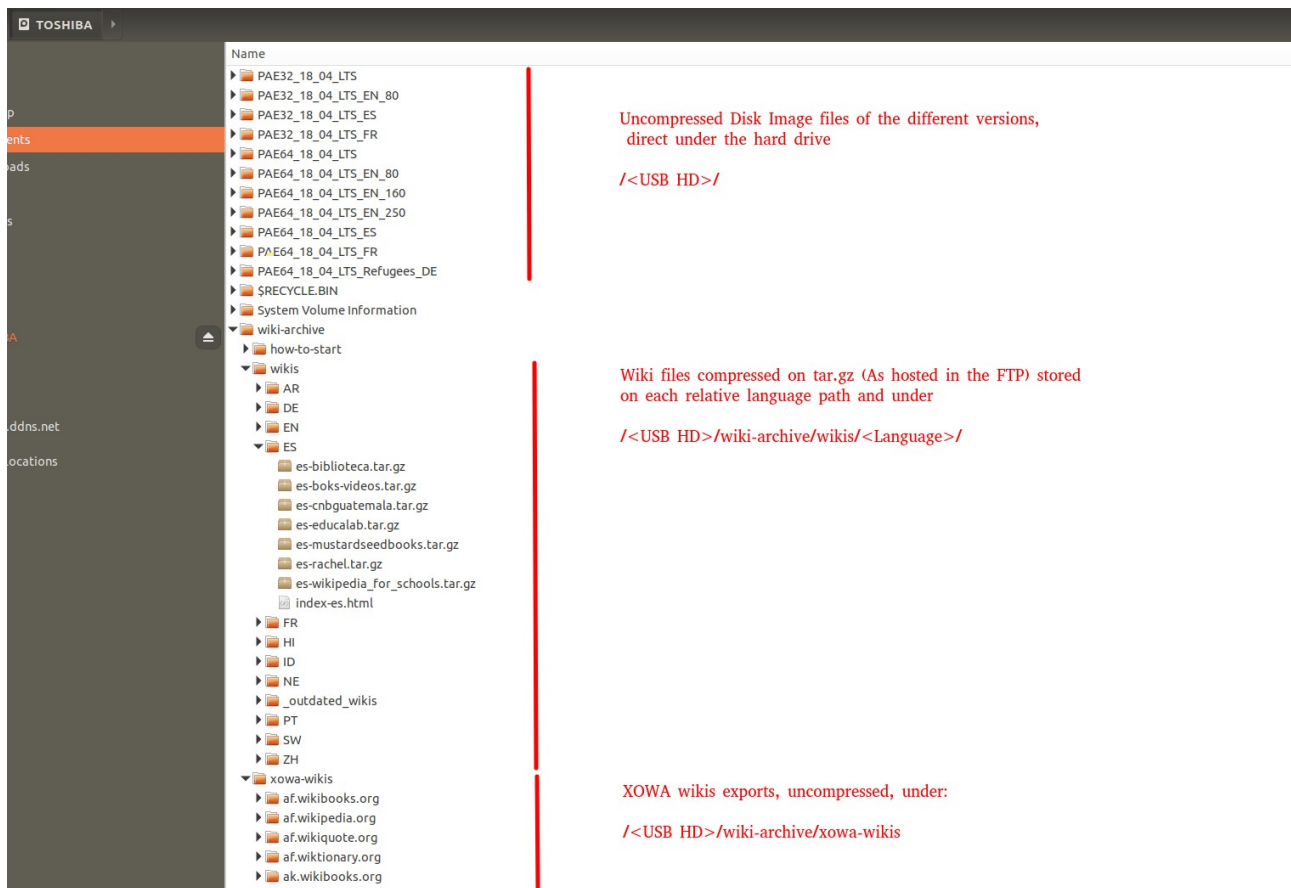

- deployment of all the additionall contents of the languages you choose automatically

## **install\_content\_labdoo.sh :**

- restore all contents that fit on the HD (based upon a configurable “priority list” of the contents [web and xowa wikis] downloaded in the HD) that fit in the HD (leaving an acceptable [and configurable] margin of free space)

## Expected structure of the files on the USB Hard Drive

The default provided scripts are configured considering the following tree on the used USB Hard drive, which is the “Stadard labdoo USB HD”.

# autodeploy\_18.sh

## Configuration Parameters

You just can configure the following information about the image files you are working with, but by default the configuration matches the images offered in the FTP server [and the ones that are installed in the “Stadard labdoo USB HD”]:

bits of the image [32,64]

language of the image [EN,ES,DE,FR]

size: maximum size of the HD in wich this image can be installed (will be used by the script to decide what to install)

name of the image

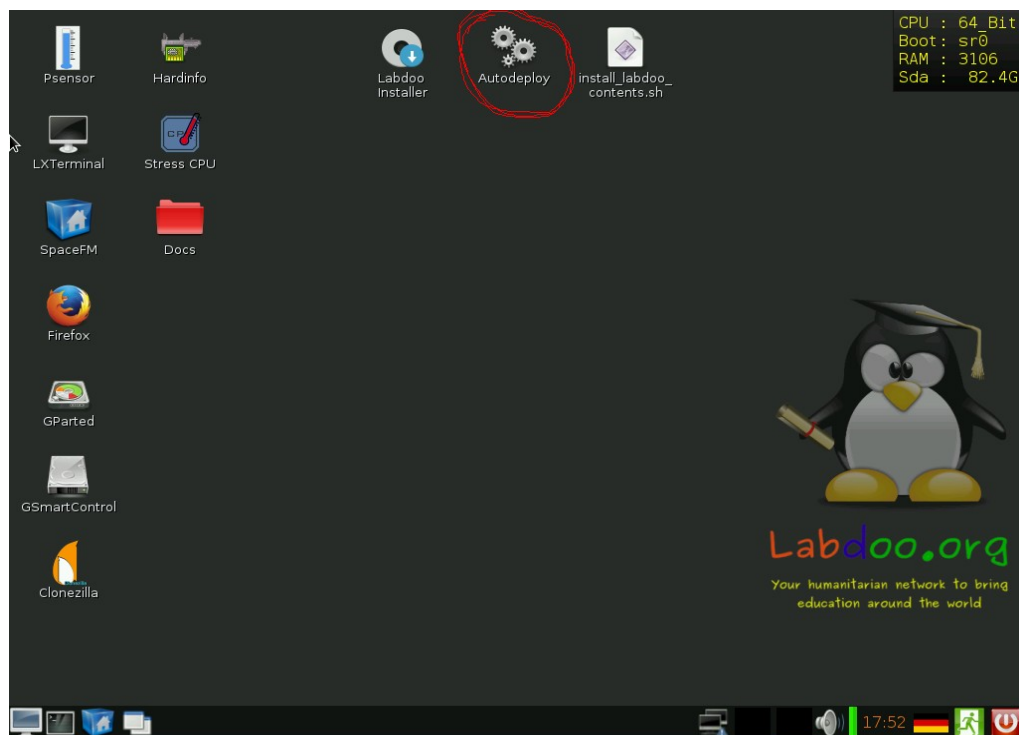

```

ARCHITECTURE, LANGUAGE, MIN_DISK_SIZE, NAME_OF_IMAGE they are
AVAILABLE_IMGS=(
    "32,EN,40,PAE32_18_04_LTS"
    "32,EN,80,PAE32_18_04_LTS_EN_80"
    "32,ES,80,PAE32_18_04_LTS_ES"
    "32,FR,80,PAE32_18_04_LTS_FR"
    "64,EN,40,PAE64_18_04_LTS"
    "64,EN,80,PAE64_18_04_LTS_EN_80"
    "64,EN,160,PAE64_18_04_LTS_EN_160"
    "64,EN,200,PAE64_18_04_LTS_EN_250"
    "64,ES,80,PAE64_18_04_LTS_ES"
    "64,FR,80,PAE64_18_04_LTS_FR"
    "64,DE,120,PAE64_18_04_LTS_Refugees_DE"
)

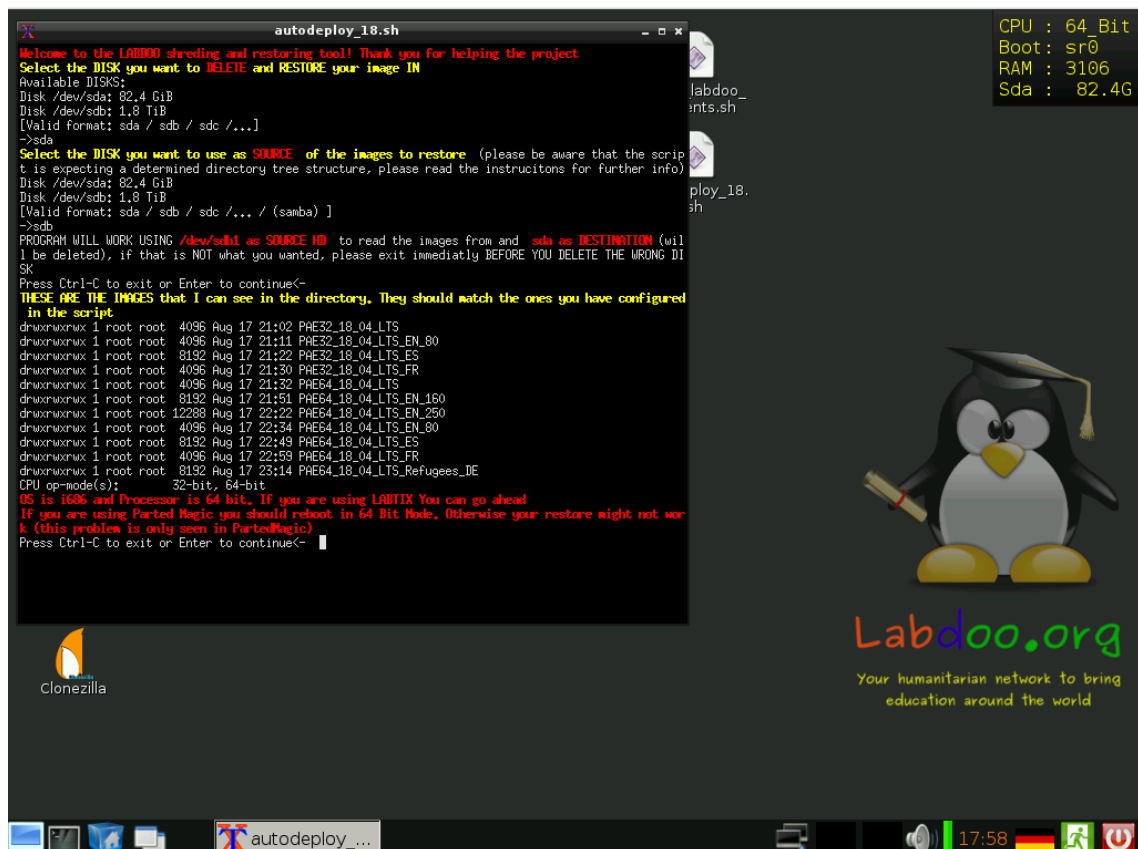

```

## Running the script

Once you have started with **Labtix**, you can execute it by clicking the Autodeploy icon in the desktop

Run the script and answer carefully the questions (specially the first ones related to the units to delete and to restore from)

```
autodeploy_18.sh
Welcome to the LABDOO shreading and restoring tool! Thank you for helping the project
Select the DISK you want to DELETE and RESTORE your image IN
Available DISKS:
Disk /dev/sda: 82.4 GiB
Disk /dev/sdb: 1.8 TiB
[Valid format: sda / sdb / sdc / ...]
->sda
Select the DISK you want to use as SOURCE of the images to restore (please be aware that the scrip
t is expecting a determined directory tree structure, please read the instructions for further info)
Disk /dev/sda: 82.4 GiB
Disk /dev/sdb: 1.8 TiB
[Valid format: sda / sdb / sdc / ... / (samba) ]
->sdb
PROGRAM WILL WORK USING /dev/sdb1 as SOURCE HD to read the images from and sda as DESTINATION (will
be deleted), if that is NOT what you wanted, please exit immediatly BEFORE YOU DELETE THE WRONG DI
SK
Press Ctrl-C to exit or Enter to continue<-
THESE ARE THE IMAGES that I can see in the directory. They should match the ones you have configured
in the script
drwxrwxr-x 1 root root 4096 Aug 17 21:02 PHE32_18_04_LTS
drwxrwxr-x 1 root root 4096 Aug 17 21:11 PHE32_18_04_LTS_EN_80
drwxrwxr-x 1 root root 8192 Aug 17 21:22 PHE32_18_04_LTS_ES
drwxrwxr-x 1 root root 4096 Aug 17 21:30 PHE32_18_04_LTS_FR
drwxrwxr-x 1 root root 4096 Aug 17 21:32 PHE64_18_04_LTS
drwxrwxr-x 1 root root 8192 Aug 17 21:51 PHE64_18_04_LTS_EN_160
drwxrwxr-x 1 root root 12288 Aug 17 22:22 PHE64_18_04_LTS_EN_250
drwxrwxr-x 1 root root 4096 Aug 17 22:34 PHE64_18_04_LTS_EN_80
drwxrwxr-x 1 root root 8192 Aug 17 22:49 PHE64_18_04_LTS_ES
drwxrwxr-x 1 root root 4096 Aug 17 22:59 PHE64_18_04_LTS_FR
drwxrwxr-x 1 root root 8192 Aug 17 23:14 PHE64_18_04_LTS_Refugees_DE
CPU op-mode(s): 32-bit, 64-bit
OS is 1606 and Processor is 64 bit, If you are using LABTIX You can go ahead
If you are using Parted Magic you should reboot in 64 Bit Mode, Otherwise your restore might not wor
k (this problem is only seen in PartedMagic)
Press Ctrl-C to exit or Enter to continue<-
```

You will be as well asked about:

- Language to restore
- Exact image to restore (system offers you, from those configured, the ones that suit the system architecture, the HD size and the selected language)

- New hostid to be set (if you have one, you can have it automatically set)

- possibility to skip the shredding (**ONLY Select if the laptop has already been erased previously or you are using a new HD, remember that deletion of data in donated laptops is mandatory**)

- possibility to install additional contents (**very recommendable, to include as much educational content as possible!!**) [it does it by automatically calling the `install_content_labdoo.sh` script]

currently supported languages:

**[ES / EN / SW / AR / HI / DE / FR / NE / ID / PT / ZH / RU / RO / IT / FA]**

- what to do after the process is finished (I personally find it usefull sending the laptop to sleep, since it allows you to save power once finished, but also to wake it up afterwards and see how the process finished [as opposed of just having it shutted down])

```

autodeploy_18.sh

So Select the number representing the option you want to install [ 0 / 1 / ... ]
-> 0
SELECTED: PVE64_18_04_LTS
If you want to want to set already a host-id, it can be automatically set during restore, just need
to give me the 5 last numbers labdoo-0000xxxxx
Write the xxxxx in labdoo-0000xxxxx if your input is empty, then the hostid will not be modified by
this script <- 12345
12345
Selection registered
NEW host ID will be set to labdoo-000012345

-----
Do you want to avoid shredding? Remember that Labdoo.org commits to the deletion of all the content
on the laptops provided.
Dont choose this if you dont have a real good reason (brand new HD for example).
If you are COMPLETELY sure you want to skip disk deletion type exactly [Yes] (or 1 or 2) [NORMALLY
JUST PRESS ENTER for normal Labdoo restoration]
->

-----
YOU CAN INSTALL ADDITIONAL CONTENTS!! Remember that you need to have the install_content_labdoo
script properly configured and the contents to install stored in your SOURCE disk following an spec
ific directory tree structure (please check the documentation if you have any doubt)

Select the languages you want the labdoo_install_content to install afterwards:
Do not be afraid, if something was already installed, the script will skip it
The disk will never get full (we leave a 10Gb free space)
Indicate the comma separated values for the contents you want to install (empty if none)
Currently supported languages: [ES / EN / SW / AR / HI / DE / FR / NE / ID / PT / ZH / RU / RO / IT / FA]
Comma separated values will install multiple languages: ie: EN (English only) / SW,EN (Swahili+Engl
ish) / ES,SW,EN (Spanish+Swahili+English) ...ES,EN,SW,AR,HI,DE,FR,NE,ID,PT,ZH,RU,RO,IT,FA (all of
them :) ) [ EN / SW,EN / ES,FA,EN / ... ]
-> ES,SW,EN,FA
After everything finishes please select if you want the program to suspend or shutdown the machine
0) Do Nothing
1) PowerOff
2) Suspend (recommended)
Select [ 0 / 1 / 2 ]<- 2

```

CPU : 64\_Bit  
 Boot : sr0  
 RAM : 3106  
 Sda : 82.4G

**Labdoo.org**  
 Your humanitarian network to bring  
 education around the world

Clonezilla

autodeploy\_18.sh

Fulfill this info and start deploying!!! :)

# install\_content\_labdoo.sh

This script is totally automated and does not require any input from the user, if you like the configuration (or after you have setted to your taste) you just have to invoke it.

It will deploy the contents, adapt the index.html file so that only the installed content is showd in firefox and run once again the “set permissions correctly” script to avoid permission problems.

**It will help you make sure that the students get all the possible content, after all, it was not so easy to bring the laptop to them**

## Configuration Parameters

You can reconfigure the following information about the content files you want to deploy but by default the configuration matches the images offered in the FTP server [and the ones that are installed in the “Stadard labdoo USB HD”] so do not change it if you dont really need:

```
#ALL THE PARAMETERS ARE RELEVANT
#1 Priority of installation
#2 How i look for it when removing it from the HTML file
#3 Where should the script look for it
#4 Where is it located
#5 Size when uncompressed

HD_AVAILABLE_CONTENT_EN=(
    "3,en.wikibooks.org,xowa/wiki/en.wikibooks.org,wiki-archive/xowa-wikis/en.wikibooks.org,292"
    "4,en.wikinews.org,xowa/wiki/en.wikinews.org,wiki-archive/xowa-wikis/en.wikinews.org,165"
    "5,en.wikipedia.org,xowa/wiki/en.wikipedia.org,wiki-archive/xowa-wikis/en.wikipedia.org,45100"
    "6,en.wikiquote.org,xowa/wiki/en.wikiquote.org,wiki-archive/xowa-wikis/en.wikiquote.org,198"
    "7,en.wikisource.org,xowa/wiki/en.wikisource.org,wiki-archive/xowa-wikis/en.wikisource.org,5000"
    "8,en.wikiiversity.org,xowa/wiki/en.wikiiversity.org,wiki-archive/xowa-wikis/en.wikiiversity.org,177"
    "9,en.wikivoyage.org,xowa/wiki/en.wikivoyage.org,wiki-archive/xowa-wikis/en.wikivoyage.org,176"
    "10,en.wiktionary.org,xowa/wiki/en.wiktionary.org,wiki-archive/xowa-wikis/en.wiktionary.org,4100"

    "31,RACHEL-EN,wikis/EN/RACHEL-EN,wiki-archive/wikis/EN/en-rachel.tar.gz,28000"
    "32,en-rachelcourses,wikis/EN/en-rachelcourses,wiki-archive/wikis/EN/en-rachelcourses.tar.gz,24000"
    "11,en-women-in-african-history,wikis/EN/en-women-in-african-history,wiki-archive/wikis/EN/en-women-in-african-history.tar.gz,1"
```

You might change at the priority order on which you want to have things deployed (until HD is full), I have given priority to the wikis and the Rachel contents as well as the “women in Africa history”, but you might change it at will (do not assign same number to different contents, otherwise one of then will be skipped)

Dont worry about the size, the script will try to install everything (if only 10 Gb are avialiable, and the first thing you have selected takes 20G, it will not break, will just skip it, and see if the next content in your priority list fits)

The installation will leave allways the space configured as **MB\_TO\_BE\_LEFT** as free, you might change this value as well

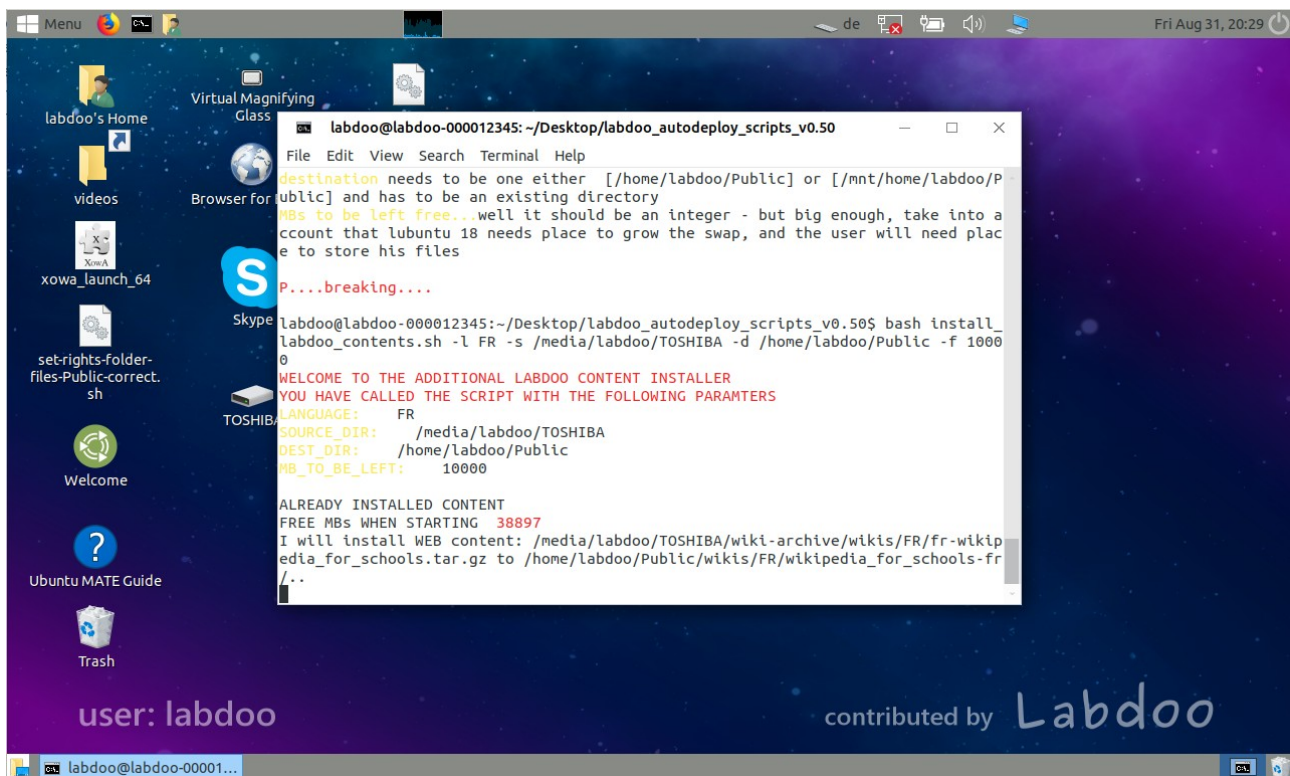

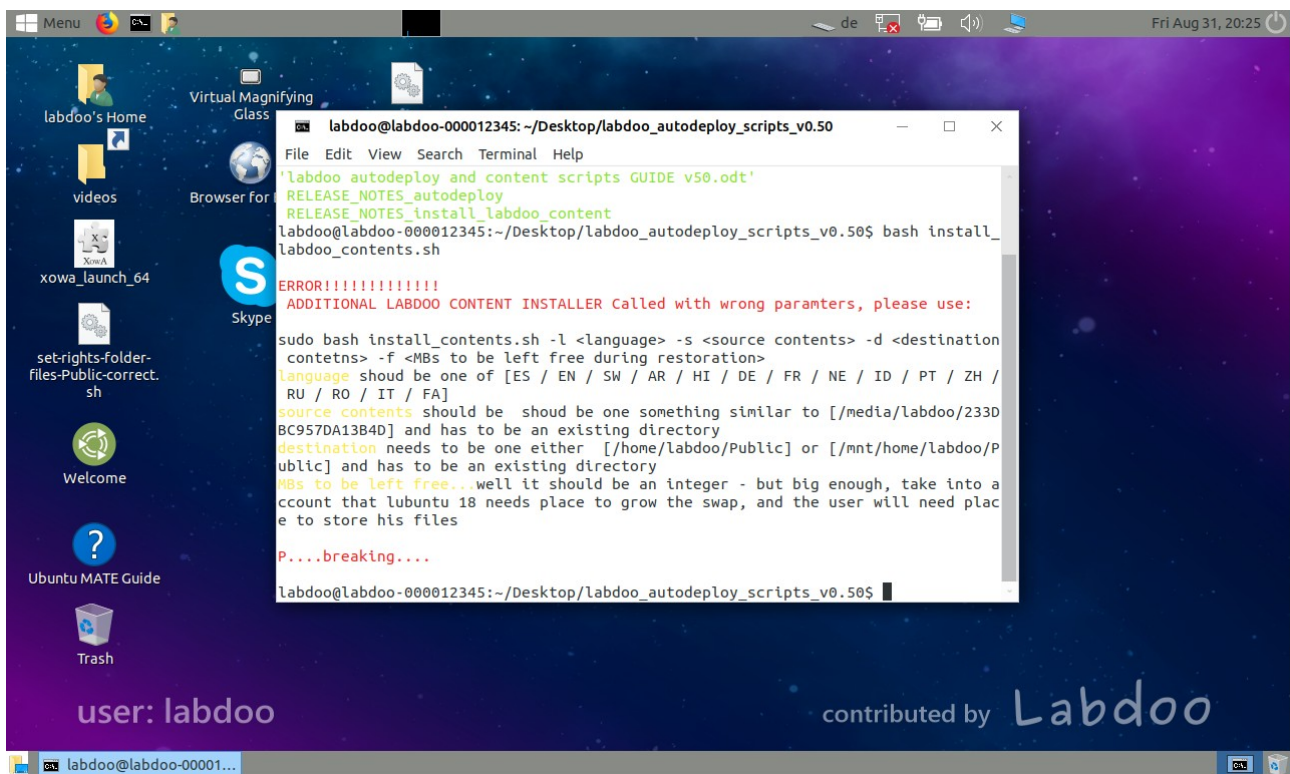

## Using the script

This is an easy one, plug the USB HD, invoke the script and go to sanitize in between a new laptop :)

Current supported languages:

[ES / EN / SW / AR / HI / DE / FR / NE / ID / PT / ZH / RU / RO / IT / FA]

DISCLAIMER: we are under constant development
